1. PROJECT OVERVIEW

1.1 Title & Tagline

Title	MediVault: A Patient-Owned Digital Health Records Platform for Seamless, Secure, and Continuous Care
Tagline	Your health data. Your control. Everywhere you need it.

1.2 Problem Statement

Healthcare today is fragmented. A patient's medical history is scattered across multiple hospitals, clinics, and doctors — locked in paper files or siloed hospital systems that do not communicate with each other. When a patient switches hospitals, moves cities, or visits a specialist, they either carry physical documents (which get lost or damaged) or start from scratch.

Doctors make decisions with incomplete information. Hospitals hold records hostage. Patients have no real ownership or visibility into their own health data. This broken system leads to:

- Duplicate tests and unnecessary costs
- Missed allergies and dangerous drug interactions
- Delayed or incorrect diagnoses
- Loss of continuity when changing hospitals
- Patients with no understanding of their own reports

1.3 Our Solution

MediVault is a unified digital health records platform where the patient is the true owner of their medical data. Records are stored in a secure, encrypted personal vault and follow the patient across hospitals, doctors, and time — not the other way around.

The platform connects four key stakeholders — Patients, Doctors, Hospitals, and Administrators — each with a role-specific dashboard designed around their actual workflow. A built-in AI document summarizer converts complex lab reports and discharge summaries into plain-language insights. A governed hospital transfer system ensures no institution can access records without explicit patient consent.

1.4 Core Principle

"Unlike existing systems where records are owned by hospitals, MediVault makes the patient the owner. Records follow the patient, not the institution. Hospitals are guests with permission — not gatekeepers."

© 2026 MediVault Team

2. SYSTEM ARCHITECTURE

2.1 High-Level Architecture

MediVault is structured as a multi-role web platform with a shared encrypted backend. All four user types interact with the same central data layer but through role-specific interfaces with strictly enforced permissions.

Component	Responsibility
Patient Dashboard	Owns and controls all health data. Requests transfers. Grants/revokes access.
Doctor Dashboard	Views assigned patient records. Creates clinical notes and prescriptions.
Hospital Dashboard	Manages its patient registry, affiliated doctors, and record transfer requests.
Admin Dashboard	Verifies doctors and hospitals. Manages platform-wide access and security.
Document Vault	Central encrypted storage layer shared across all roles with patient-controlled permissions.
AI Summarizer	Reads uploaded medical documents and generates plain-language summaries.
Transfer Engine	Governs hospital switching, consent flows, and emergency access protocols.
Notification Centre	Real-time alerts for all four dashboard types, per-role filtered.

2.2 User Roles & Access Levels

Role	Access Scope
Patient	Full ownership of own records. Can grant, limit, or revoke access to any party.
Doctor	Read/write access only to records of assigned patients. Verified by Admin.
Hospital	Read/write access to its own patient registry. Cannot access other hospitals' patients.
Admin	Super-access for verification and audit. Cannot read patient medical content.

2.3 Technology Stack (Recommended)

Layer	Technology
Frontend	React.js with role-based routing and protected dashboard views
Backend	Node.js / Express REST API with JWT authentication
Database	PostgreSQL for structured records + AWS S3 / Firebase Storage for

© 2026 MediVault Team

Layer	Technology
	document files
AI Layer	Claude API or OpenAI API for document summarization
Authentication	OTP-based (SMS/email) + optional Aadhaar-linked national ID
Encryption	AES-256 at rest, TLS 1.3 in transit, per-user encryption keys for vault
Hosting	AWS / GCP / Vercel + Cloudflare for edge security

© 2026 MediVault Team

3. VERIFICATION & IDENTITY SYSTEM

Trust is the foundation of MediVault. No doctor, patient, or hospital can participate on the platform without being verified. The following verification flows are enforced before any account becomes active.

3.1 Patient Verification

- OTP verification via registered mobile number and email address at signup
- Profile activation only after both OTP challenges are completed
- Optional: national ID (Aadhaar / PAN) linking for stronger identity assurance
- Accounts flagged for suspicious activity are escalated to Admin review queue
- A verified badge appears on the patient's profile visible to their linked doctor

3.2 Doctor Verification

- Doctor submits: medical license number, specialisation, hospital affiliation, degree certificate, and government-issued ID
- Submission enters the Admin verification queue — account is inactive until approved
- Admin reviews documents and either Approves, Rejects, or requests additional information
- On approval, a Verified Doctor badge is activated on their profile, visible to patients
- Periodic re-verification reminders are sent when licenses approach expiry
- Rejected doctors receive the specific reason and can resubmit with corrections

3.3 Hospital Verification

- Hospital submits: registration certificate, address proof, and administrator contact
- Admin onboards verified hospitals and assigns a Hospital Admin user for that institution
- Hospital Admin can then manage their own doctors and patient registry
- Admin can disable a hospital's access at any time for compliance violations

© 2026 MediVault Team

4. PATIENT DASHBOARD

The patient dashboard is the personal health command centre. Everything is designed around the patient's need to understand, manage, and control their health information with minimal technical knowledge required.

4.1 Profile & Identity

Feature	Description
Verified Digital Health ID	Unique patient ID generated on signup, linked to OTP-verified phone/email
Personal Health Profile	Name, age, date of birth, blood group, gender, address, emergency contacts
Insurance Details	Insurance provider, policy number, and coverage summary stored in profile
Profile Completeness Score	Visual progress indicator nudging patients to fill in missing fields
Verified Badge	Displayed once OTP and identity verification are complete

4.2 Health Overview

Feature	Description
Active Conditions	Current diagnoses listed with associated doctor and onset date
Active Medications	Ongoing prescriptions with drug name, dosage, and frequency
Ongoing Treatments	Current treatment plans and their status
Vitals History Graph	Line graphs for BP, blood sugar, weight, SpO2 plotted over time
Upcoming Appointments	Next scheduled visits with doctor name, date, time, and hospital
Appointment Reminders	Push notification, SMS, and email reminders before appointments

4.3 Document Vault Access

Feature	Description
Upload Records	Patient can upload scans, reports, discharge summaries as PDF/images
Organised View	All records sorted by date, document type, hospital, and doctor
AI Document Summarizer	Upload any medical document to receive a plain-language summary with highlighted abnormal values and suggested follow-up questions
Download Records	Export any record as a watermarked PDF
Share Access	Grant a specific doctor or hospital access to a specific document
Revoke Access	Remove previously granted access to any document at any time

© 2026 MediVault Team

4.4 Hospital & Doctor Management

Feature	Description
Linked Hospital View	See current primary hospital and all historically linked hospitals
Primary Doctor View	Currently assigned doctor with contact and specialisation details
Hospital Transfer Request	Formal request flow to move to a new hospital with old hospital notification
Emergency Read Access	Grant a new hospital temporary time-limited read-only access in urgent situations
Access Expiry Timer	Emergency access automatically revokes after the defined time period
Audit Trail	Full log of every doctor and hospital that accessed the patient's records, with timestamps

4.5 Appointments

Feature	Description
Book Appointment	Select doctor, date, and time from available slots
Reschedule	Change appointment date or time before the visit
Cancel Appointment	Cancel with optional reason; doctor is automatically notified
Prescription Refill Request	Request renewal of an ongoing prescription through the dashboard

4.6 Health Timeline

A chronological visual scroll of the patient's entire medical life — every diagnosis, surgery, hospitalisation, medication start/stop, and uploaded report plotted on a single interactive timeline. This gives both the patient and their doctor a complete picture of health history at a glance, without manually searching through individual records.

4.7 Notification Centre

A unified notification inbox inside the patient dashboard. All alerts are collected here in addition to being sent via SMS/email. Notification types include:

- Appointment reminders (24 hours before and 1 hour before)
- Record access alerts (who viewed a document and when)
- Hospital transfer request status updates (approved, pending, declined)
- Prescription renewal reminders
- Doctor verification status if the patient's assigned doctor resubmits credentials
- New records added to vault by a linked doctor or hospital

© 2026 MediVault Team

5. DOCTOR DASHBOARD

The doctor dashboard is engineered around a clinician's actual workflow — fast information retrieval, minimal navigation, high information density. A busy doctor should be able to open the dashboard, see today's schedule, and access any patient's critical information in under three clicks.

5.1 Smart Schedule & Queue

Feature	Description
Today's Appointment Timeline	All scheduled patients laid out chronologically with current status
Patient Status Tracking	Each appointment slot shows: Arrived / Waiting / In-Consultation / Done
Urgency Colour Coding	Appointments tagged as Routine (green), Follow-up (blue), Urgent (orange), or Emergency (red)
Running Late Button	One tap notifies all waiting patients that the doctor is running behind schedule

5.2 Patient Quick-Access Cards

Feature	Description
One-Click Summary	Clicking a scheduled patient shows: last visit notes, active medications, and latest vitals instantly
Pre-Consultation Alert	Flags critical information the doctor must know before the visit — e.g. patient is on blood thinners

5.3 Record & Note Creation

Feature	Description
SOAP Notes Template	Structured clinical note format: Subjective, Objective, Assessment, Plan
e-Prescription Builder	Write prescriptions with drug name, dosage, frequency, and duration; auto-saved to patient vault
Auto-Attach to Vault	All notes and prescriptions created here are automatically added to the patient's document vault

5.4 AI Assistant for Doctors

When a patient uploads a document (lab report, discharge summary, imaging report), the doctor can view an AI-generated structured summary directly within the consultation interface. The summary includes:

- A concise plain-language overview of findings
- Abnormal values highlighted separately in a flagged section
- Values presented in clinical context (e.g. 'LDL at 160 mg/dL — above recommended threshold')

© 2026 MediVault Team

This saves the doctor from reading dense multi-page PDFs during a busy consultation, while ensuring no critical findings are missed.

5.5 Workload & Analytics

Feature	Description
Weekly Patient Volume	Total consultations completed per week with trend indicator
Average Consultation Time	Average time per patient to help manage scheduling
Pending Follow-Ups	List of patients who were scheduled for follow-up but have not booked yet
Overdue Reviews	Patients whose last visit was beyond the recommended review interval

5.6 Verification Badge & Account

Feature	Description
Registration	Doctor submits license number, specialisation, hospital affiliation, and ID documents
Pending State	Account is view-limited until Admin approves credentials
Verified Badge	Displayed on doctor profile once approved — visible to all assigned patients
Re-Verification	System sends reminder before license expiry; doctor must resubmit to stay active

5.7 Notification Centre

Doctor notification types:

- New patient assigned by hospital
- Appointment booking, reschedule, or cancellation by a patient
- Pending follow-up alerts for patients overdue for review
- Admin verification approval, rejection, or re-verification request
- New document uploaded to vault by an assigned patient

© 2026 MediVault Team

6. HOSPITAL DASHBOARD

The hospital dashboard serves as the institutional control panel. Hospital administrators manage their patient registry, affiliated doctors, compliance reporting, and the critically important record transfer governance system.

6.1 Patient Registry

Feature	Description
Active Admissions	All currently admitted inpatients with ward, bed, and assigned doctor
OPD Patients	Outpatient visits scheduled for today and this week
Discharged Patients	Historical discharge records with discharge summary links
Scheduled Patients	Upcoming appointments booked at this hospital

6.2 Record Transfer Governance

This is one of MediVault's most critical institutional features. The hospital does not own the records — it is a custodian with patient-granted access. All transfer scenarios are handled through a formal governed flow:

Scenario	System Response
Patient formally requests transfer	Old hospital is notified. Must approve or partially approve before records migrate to new hospital.
Patient visits new hospital without notice	New hospital can request 24-hour emergency read-only access. Old hospital receives an immediate alert.
Patient wants parallel care	Patient grants both hospitals concurrent limited access. Both are aware of the arrangement.
Patient wants to unlink the hospital	Hospital access is flagged for removal. A 30-day grace period applies, then access is revoked.
Emergency — patient unconscious	New hospital gets critical-records-only emergency override. Full audit trail is generated.
Unlinked Access Attempt	If a hospital attempts to access records without authorisation, the system flags and blocks it, and notifies the patient.

Approve / Partial Approve / Decline controls are available for each incoming request. Transfer history is fully logged for compliance and audit.

6.3 Doctor Management

Feature	Description
Affiliated Doctors List	All doctors registered under this hospital with verification status
Schedule View	Each doctor's appointment schedule and availability

© 2026 MediVault Team

Feature	Description
Patient Assignment	Assign incoming patients to available doctors
Reassignment	Move patients between doctors in case of leave, overload, or specialisation mismatch
Consultation Load Monitor	Visual load indicator per doctor to prevent overloading any single clinician

6.4 Vault & Compliance

Feature	Description
Hospital Document Storage	Store institution-level documents: OT reports, discharge summaries, imaging
Access Logs	Full log of every record viewed, by whom, and when — filterable by date and user
HIPAA / DPDP Compliance Reports	Auto-generated compliance reports exportable in standard formats

6.5 Analytics

Feature	Description
Patient Inflow / Outflow	Monthly trends of admissions, discharges, and transfers
Common Diagnoses	Top conditions treated, useful for resource planning
Admission Reasons	Breakdown of why patients are admitted (emergency, elective, referral)
Average Stay Duration	Mean inpatient days per department or condition
Readmission Rates	Percentage of patients readmitted within 30 days — a key quality metric

6.6 Notification Centre

Hospital notification types:

- Incoming hospital transfer requests from patients
- Unlinked access attempt alerts
- Doctor verification status updates from Admin
- Compliance report generation completions
- New patient registrations linked to this hospital

© 2026 MediVault Team

7. ADMIN DASHBOARD

The Admin dashboard is the platform's control tower. Admins do not access patient medical content — their role is purely governance: verifying identities, maintaining trust, and monitoring platform-wide security.

7.1 Doctor Verification Workflow

Feature	Description
Pending Queue	All new doctor registrations awaiting review, sorted by submission date
Document Review	View submitted license, degree, and ID documents side by side
Approve	Activates doctor account and enables the Verified badge
Reject	Sends rejection with mandatory reason field; doctor can resubmit
Request More Info	Sends a specific query to the doctor without fully rejecting
Re-Verification Reminders	Auto-triggered alerts to doctors as license expiry approaches

7.2 Patient Verification Oversight

Feature	Description
OTP Verification Status	Monitor which patient accounts have completed phone and email OTP
Suspicious Account Flagging	Accounts with unusual activity (multiple IPs, rapid data access) are escalated for review
Manual Review Queue	Flagged accounts appear here for Admin investigation

7.3 Hospital Onboarding

Feature	Description
Register Hospital	Add new hospitals to the platform with registration details
Assign Hospital Admin	Designate an admin user responsible for that hospital's management
Enable / Disable Access	Turn hospital access on or off, e.g. for compliance violations or contractual reasons
Data Sharing Policy	Set institution-level rules for what data can be shared and under what conditions

7.4 Platform-Wide Controls

Feature	Description
Role & Permission Management	Define and adjust what each role can see and do across the platform
Feature Flags	Enable or disable specific features (e.g. AI summarizer) per hospital or

© 2026 MediVault Team

Feature	Description
	globally
System-Wide Announcements	Broadcast messages to all users or specific user groups

7.5 Audit & Security

Feature	Description
Complete Access Logs	Every action logged: login, record view, document upload, access grant/revoke
Breach Detection Alerts	Automated alerts for anomalous behaviour: bulk downloads, off-hours access, repeated failed logins
Data Export Controls	Restrict and monitor large-scale data exports to prevent unauthorised data harvesting

7.6 Notification Centre

Admin notification types:

- New doctor verification requests pending review
- Flagged or suspicious patient/doctor accounts
- Hospital onboarding requests
- Breach detection alerts and security anomalies
- Platform usage thresholds and storage alerts

© 2026 MediVault Team

8. DOCUMENT VAULT

The Document Vault is the heart of MediVault. It is the single source of truth for all patient medical records, accessible from anywhere, controlled entirely by the patient, and secured at every layer.

8.1 Storage & Organisation

Document Category	Contents
Lab Reports	Blood tests, urine analysis, pathology reports, culture reports
Prescriptions	All e-prescriptions created by doctors and uploaded by patients
Imaging	X-Rays, MRI scans, CT scans, Ultrasound reports
Discharge Summaries	Hospital discharge documents with diagnosis and treatment summary
Vaccination Records	Immunisation history with dates and vaccine batch details
Insurance Documents	Policy documents, claim forms, pre-authorisation letters
Surgery Notes	Operation notes, anaesthesia records, post-op instructions

All documents are also available in a chronological Timeline View showing the patient's complete medical paper trail across all hospitals in date order.

8.2 Access Control

Access Type	Description
Full Access	Granted to a doctor or hospital for complete record visibility
Read-Only Access	View records but cannot add, edit, or delete anything
Time-Limited Access	Access automatically expires after a defined period (hours or days)
Emergency Access	Critical-records-only access for life-threatening situations with mandatory audit trail
Revoke Access	Patient can remove any party's access at any time with immediate effect
Watermarked Exports	PDF downloads include patient name, date, and access credentials to prevent misuse

8.3 AI Document Summarizer

When a patient or doctor uploads any medical document to the vault, the AI summarizer processes it and generates three outputs:

Output	Description
Plain Summary	A 3-5 sentence explanation of the document in everyday language a non-medical person can understand. Example: Your kidney function tests are within normal range. Your

© 2026 MediVault Team

	haemoglobin is slightly low at 10.2 g/dL, which may explain your fatigue.
Abnormal Highlights	Values outside normal reference ranges are listed separately and flagged with their clinical significance explained simply.
Follow-up Questions	Suggested questions the patient should ask their doctor at the next visit, generated from the findings in the document.

8.4 Security Architecture

Security Measure	Implementation
Encryption at Rest	AES-256 encryption on all stored documents and database fields
Encryption in Transit	TLS 1.3 for all data moving between client and server
Two-Factor Authentication	Required for vault access — OTP sent to registered mobile
Virus / Malware Scanning	Every uploaded file is scanned automatically before storage
Per-User Encryption Keys	Patient's vault is encrypted with a key derived from their credentials
Access Logs	Every document view is logged with user identity and timestamp

© 2026 MediVault Team

9. HOSPITAL TRANSFER & CONTINUITY OF CARE

This module is MediVault's flagship differentiator. It governs the most common and most poorly handled scenario in Indian healthcare — the patient who changes hospitals. The system ensures records follow the patient, with or without the old hospital's cooperation, while maintaining security and consent at every step.

9.1 Transfer Scenarios

Scenario	System Response
Patient formally requests transfer	Patient initiates transfer from their dashboard. Old hospital is notified and must Approve, Partially Approve, or Decline within 72 hours. On approval, selected records migrate to new hospital.
Patient visits new hospital without notice	New hospital can request 24-hour emergency read-only access. Old hospital receives an immediate alert. Patient is notified of the access request.
Patient wants parallel care (two hospitals)	Patient manually grants both hospitals concurrent limited access. Both institutions can see they are not the sole provider.
Patient wants to unlink a hospital	Patient initiates unlink. Hospital is notified. A 30-day grace period allows for data reconciliation. After 30 days, access is fully revoked.
Emergency — patient unconscious	Treating hospital can trigger emergency override. Access is limited to critical records only (blood group, allergies, active medications, conditions). Full audit trail is mandatory.
Unlinked access attempt	Any attempt by a hospital to access records without authorisation is blocked, flagged in the admin audit system, and the patient is notified immediately.

9.2 Transfer Flow — Step by Step

- Step 1: Patient opens Hospital Management section and selects 'Request Transfer'
- Step 2: Patient selects the new hospital from the registered hospital list
- Step 3: Patient selects which records to include in the transfer (all or specific documents)
- Step 4: Old hospital receives notification with 72-hour response window
- Step 5: Old hospital reviews and approves, partially approves, or declines with reason
- Step 6: On approval, selected records become accessible to the new hospital
- Step 7: Patient receives confirmation. Audit trail is recorded for both hospitals.

9.3 Emergency Access Protocol

When a patient arrives at a hospital unconscious or incapacitated, the treating doctor can activate Emergency Access through their dashboard. This access:

- Is limited strictly to critical information: blood group, known allergies, active conditions, and current medications
- Lasts for a maximum of 24 hours from activation time

© 2026 MediVault Team

- Generates an immutable audit log entry that cannot be deleted
- Notifies the patient's registered emergency contact
- Notifies the patient's primary hospital and assigned doctor
- Can be reviewed and extended by the patient once conscious, or expires automatically

© 2026 MediVault Team

10. ADDITIONAL FEATURES

10.1 Health Timeline (Patient)

A dedicated full-screen view showing the patient's complete medical history as a vertically scrolling interactive timeline. Each event appears as a node on the timeline with:

- Event type (diagnosis, hospitalisation, surgery, vaccination, prescription start/stop)
- Date and hospital or clinic where the event occurred
- Linked document if available (e.g. clicking a lab report node opens the AI summary)
- Doctor who created or recorded the event

The timeline is automatically built from all uploaded and created records. The patient does not need to manually add events — the system constructs it from vault data.

10.2 Notification Centre (All Roles)

Each dashboard has a dedicated Notification Centre as a persistent inbox — separate from external SMS/email alerts. Features include:

- All-in-one alert inbox filterable by type (appointment, access, transfer, verification)
- Read / unread status per notification
- Direct action buttons within notifications (e.g. 'View Request', 'Approve Transfer', 'Book Appointment')
- Notification history retained for 90 days
- Unread count badge on the dashboard navigation icon

© 2026 MediVault Team

11. KEY USER FLOWS

11.1 New Patient Registration

- Patient visits MediVault and selects 'Register as Patient'
- Enters name, mobile number, email, and creates a password
- OTP sent to mobile — verified
- OTP sent to email — verified
- Completes health profile: age, blood group, emergency contacts
- Optional: links national ID for enhanced verification
- Dashboard is activated. Profile completeness score shown.

11.2 Doctor Onboarding

- Doctor selects 'Register as Doctor'
- Enters name, specialisation, hospital affiliation, mobile, and email
- Uploads: medical license, degree certificate, government-issued ID
- Account enters Pending state — limited access until Admin approval
- Admin reviews documents in verification queue
- On approval: Verified badge activated, doctor can now access assigned patients
- Doctor sets up schedule and availability

11.3 Patient Uploading a Lab Report and Getting a Summary

- Patient logs in and opens Document Vault
- Selects 'Upload Document' and chooses the category (Lab Report)
- Uploads the PDF file from their device
- System scans for malware. File is encrypted and stored.
- AI summarizer processes the document automatically
- Patient receives notification: 'Your lab report summary is ready'
- Patient opens the summary: sees plain-language overview, flagged abnormal values, and follow-up questions
- Patient can share the document with their doctor from the same screen

11.4 Hospital Transfer Request

- Patient opens 'Hospital & Doctor Management' section
- Selects 'Request Hospital Transfer' and chooses the destination hospital
- Selects documents to include in the transfer

© 2026 MediVault Team

- Confirms and submits the request
- Old hospital receives notification with 72-hour response window
- Old hospital approves the transfer through their dashboard
- New hospital gains access to the selected records
- Patient's audit trail is updated. Both hospitals are notified of completion.

© 2026 MediVault Team

12. SECURITY & COMPLIANCE

12.1 Data Privacy

- Patient data is never sold or shared with third parties
- Doctors and hospitals only see data they have explicit permission to see
- Admin staff cannot read patient medical content — only metadata for governance
- All data processing follows DPDP Act 2023 (India) principles and is HIPAA-aligned

12.2 Security Measures

Measure	Scope
AES-256 Encryption	All stored documents and sensitive database fields
TLS 1.3	All API calls and data in transit
Two-Factor Authentication	Required for all users on sensitive actions (vault access, transfer approval)
JWT Token Authentication	Short-lived access tokens with refresh token rotation
Role-Based Access Control	Strict RBAC preventing cross-role data access
Malware Scanning	Every uploaded file scanned before storage
Audit Logging	Immutable logs for every data access and modification event
Breach Detection	Automated alerting for anomalous usage patterns
Data Export Controls	Bulk exports require elevated permission and generate alerts

© 2026 MediVault Team

13. FUTURE SCOPE

The following features are identified as valuable extensions to MediVault beyond the initial hackathon version. They are not part of the current build but are architecturally planned for.

Feature	Description
Family Accounts	One login to manage health records for elderly parents or children under guardianship
Insurance Claim Bundler	Auto-compile all records relevant to an insurance claim into a single download package
Multilingual Support	Interface in Hindi, Telugu, Tamil, and other regional languages for wider accessibility
Offline Mode	Doctors can view cached patient records without internet connectivity during ward rounds
QR Health Card	A scannable QR code on the patient's profile showing critical emergency information only
Teleconsultation Integration	Video call link embedded in appointment for remote consultations
Patient-Reported Outcomes	Pre-visit forms filled by patients that doctors see before the appointment begins
Bed & Ward Management	Integration hook for hospitals to link live bed availability to the dashboard

© 2026 MediVault Team

14. GLOSSARY

Term	Definition
SOAP Notes	Structured clinical documentation format: Subjective, Objective, Assessment, Plan
OTP	One-Time Password — a single-use code sent to phone or email for identity verification
RBAC	Role-Based Access Control — restricting system access based on a user's role
DPDP Act	Digital Personal Data Protection Act 2023 — India's primary data privacy legislation
HIPAA	Health Insurance Portability and Accountability Act — US healthcare data privacy standard
AES-256	Advanced Encryption Standard with 256-bit key — industry standard for data encryption
TLS 1.3	Transport Layer Security version 1.3 — protocol for secure internet communications
JWT	JSON Web Token — a compact method for securely transmitting authentication data
Transfer Engine	MediVault's proprietary module governing hospital switching and record migration
Vault	The encrypted personal document storage space owned by each patient
Verified Badge	A visual indicator confirming that a doctor or patient has passed identity verification
Audit Trail	An immutable chronological record of all access and modification events

© 2026 MediVault Team

MEDIVAULT

Your health data. Your control. Everywhere you need it.

Hackathon Project | Version 1.0 | 2026

© 2026 MediVault Team
